

PRESS RELEASE

Brain-on-a-chip axonal strain injury model highlights mitochondrial membrane potential threshold and assesses potential new therapeutic

Two organotypic hippocampal slices are cultured on an elastic surface.

Researchers from the Biomedical Engineering Department of Rutgers, The State University of New Jersey recently demonstrated the use of their “Brain-on-a-Chip” microsystem to assess specific effects of traumatic axonal injury. While their model uses the three dimensional cell structure and networks found in intact animals, it is capable of visualizing individual axons and their responses to mechanical injury. This is done by utilizing organotypic slices taken from specific areas in the brain that are susceptible to injury during a traumatic brain injury event. “What’s really nice about the system is that it is very versatile, in that specific physiologically relevant pathways or networks can be monitored depending on the orientation of the slices placed in the device, or by which brain slices are used” says Jean-Pierre Dollé, Ph.D., lead author. Through the use of very small microchannels, the authors direct the natural response of brain slices to extend axons to connect one brain slice to another. Once the extending axons have traversed the distance and made functional connections between the brain slices, these axons are ready to be selectively injured.

This innovative approach was used to characterize the biochemical changes that are induced following traumatic axonal injury and highlights an apparent injury threshold that exists in axonal mitochondria. Their research shows that below the injury threshold mitochondria undergo a delayed hyperpolarization, whereas above the threshold they immediately depolarize. Using their system, the authors tested a novel therapeutic candidate, in which they showed that the sodium/hydrogen exchange inhibitor EIPA could significantly reduce the mitochondrial responses to injury resulting in an overall improvement in axonal health. “Since therapeutic options are currently limited, these results are exciting and highlight the value of our brain-on-a-chip technology that can be used for high-throughput screens of potential agents to ameliorate the consequences of diffuse axonal injury, which often accompanies traumatic brain injury” says senior author Martin Yarmush MD, Ph.D.

Additional co-authors of the TECHNOLOGY paper are Rene R. Schloss Ph.D. from Biomedical Engineering, Rutgers University and Barclay Morrison III Ph.D. from Biomedical Engineering, Columbia University.

This work was supported in part by grants from the New Jersey Commission for Brain Injury Research (BIR-1.08.016), the National Institute of Biomedical Imaging and Bioengineering (NIH P41 EB002503), and the National Institute of General Medical Sciences (Rutgers-UMDNJ Biotechnology Training Program: T32 GM008339).

Corresponding author for this study in TECHNOLOGY is Martin L. Yarmush, yarmush@rci.rutgers.edu.

About TECHNOLOGY

Fashioned as a high-impact, high-visibility, top-echelon publication, this new ground-breaking journal — TECHNOLOGY — will feature the development of cutting-edge new technologies in a broad array of emerging fields of science and engineering. The content will have an applied science and technological slant with a focus on both innovation and application to daily lives. It will cover diverse disciplines such as health and life science, energy and environment, advanced materials, technology-based manufacturing, information science and technology, and marine and transportations technologies.

About World Scientific Publishing Co.

World Scientific Publishing is a leading independent publisher of books and journals for the scholarly, research and professional communities. The company publishes about 500 books annually and more than 120 journals in various fields. World Scientific collaborates with prestigious organisations like the Nobel Foundation, US National Academies Press, as well as its subsidiary, the Imperial College Press, amongst others, to bring high quality academic and professional content to researchers and academics worldwide. To find out more about World Scientific, please visit www.worldscientific.com.
