

## PRESS RELEASE

# Biogas to biomethane upgrading by water absorption column at low pressure and temperature

May 8, 2015 – A technology based on the absorption of carbon dioxide using water is reported in this paper. Compared to other processes the innovation lies in the operating conditions. Instead of enhancing the solubility of carbon dioxide working with a pressurized system, low absorption temperature is employed. In this configuration, two main advantages can be obtained: there are no duty costs for pressurizing the system and there is no need of cleaning the absorption solvent, since the solubility of carbon dioxide in water at ambient pressure is low and any further treatment of the wastewater can be avoided. The new technology here proposed involves the use of two absorption columns: the first at atmospheric pressure for the removal of the main part of CO<sub>2</sub> and the second one, of reduced dimension, for the final purification of biomethane.

*Flowsheet of the experimental apparatus used for the absorption study and main results obtained in term of difference between the carbon dioxide concentration entering and exiting from the column depending on the different experimental conditions.*

A team of researchers from the Università degli Studi di Milano and Politecnico di Milano in Italy, have demonstrated the possibility to perform a first important step in the biogas upgrading to biomethane using cost-effective conditions in terms of pressure and temperature by physical absorption column technology. The work was developed both from an experimental and computational point of view. The experimental work was made by the experimental apparatus reported in the figure, while the simulation study was performed by using PRO II SIMSCI simulation software. The report will appear in the TECHNOLOGY journal.

“We propose a well known technology for the separation of CO<sub>2</sub> from biogas mixture, but using different operating conditions relative to the traditional one. Our idea is to perform the absorption of CO<sub>2</sub> in water by using low temperature (in the range 5–15°C) coupled with atmospheric pressure. This technology involves the use of two absorption columns: the first at atmospheric pressure for the removal of the main part of CO<sub>2</sub> and the second one, of reduced dimension, for the final purification of biomethane. This study demonstrated the feasibility of the first step of this approach, while ongoing research to validate the whole process of the double column configuration is now in process,” says Professor Carlo Pirola, Ph.D., of the Università degli Studi di Milano and Principal Investigator of this paper.

Additional co-authors are Federico Galli, Ph.D. student, Claudia Bianchi, Ph.D., and Flavio Manenti, Ph.D.  
This work was funded by the Università degli Studi di Milano and Politecnico di Milano.

## About TECHNOLOGY

Fashioned as a high-impact, high-visibility, top-echelon publication, this new ground-breaking journal — TECHNOLOGY — will feature the development of cutting-edge new technologies in a broad array of emerging fields of science and engineering. The content will have an applied science and technological slant with a focus on both innovation and application to daily lives. It will cover diverse disciplines such as health and life science, energy and environment, advanced materials, technology-based manufacturing, information science and technology, and marine and transportations technologies.

## About World Scientific Publishing Co.

World Scientific Publishing is a leading independent publisher of books and journals for the scholarly, research and professional communities. The company publishes about 500 books annually and more than 120 journals in various fields. World Scientific collaborates with prestigious organisations like the Nobel Foundation, US National Academies Press, as well as its subsidiary, the Imperial College Press, amongst others, to bring high quality academic and professional content to researchers and academics worldwide. To find out more about World Scientific, please visit [www.worldscientific.com](http://www.worldscientific.com).
