

PRESS RELEASE

Intermittently delivered pulsed electric fields technology could replace boiling and refrigeration of milk in the low-income countries

March 27, 2015 — High voltage, short pulsed electric fields selectively damage cell membrane directly killing the contaminating bacteria by a process known as electroporation. Once applied multiple times, this process prevents bacteria proliferation in milk during storage.

Preserving the milk using energy efficient pulsed electric field processing

Milk is a key element for household food security and provides a stable income to farmers including women, who are usually in charge of taking care of the milk-producing animals in the low-income countries. Currently pathogen growth in milk is managed with refrigeration or with chemicals. Although bacterial growth in milk is managed with refrigeration in the high-income countries, a high cost of infrastructure and a demand for a permanent electricity supply prevent milk refrigeration in the rural areas in the low-income countries. Moreover, certain pathogens, for example *Listeria monocytogenes*, are less sensitive to low temperature; therefore, they can proliferate at refrigeration during transportation and storage.

“There is a constant search for new, low-cost, chemical-free technologies for milk preservation, especially for the small farmers in the low-income countries,” says Alexander Golberg, PhD of Porter School at TAU, the paper’s author. “In many rural places refrigeration is not possible and its alternative, lactoperoxidase system may be misused to disguise milk produced under poor hygienic conditions as Codex Alimentarius. This development not only holds great promise for unraveling many aspects of the complex wound healing process but can also potentially lead to new therapies,” Golberg says, “We believe that this model will enable other laboratories to learn and uncover new aspects of adult tissue growth and development.”

Pulsed electric fields is an emerging technology in the food industry. It was shown in multiple studies to effectively kill multiple food born microorganisms and could provide an alternative, non-thermal pasteurization process. “In the storage application, developed in this work, we use the fundamentally different approach for microorganisms control. Refrigeration, the major milk preservation technology, slows the bacteria metabolism, pulsed electric fields kill them.” Alex Golberg says. “Moreover, Our model shows that pulsed electric fields preservation technology does not require a constant electricity supply and can be powered 5.5 hours a day using small, family scale solar panels. I believe that this technology can provide a robust, simple and energy-efficient milk preservation system that would decrease the wasted milk thus increasing the income of the small farmers in developing countries.”

The author acknowledges Prof. Boris Rubinsky from UC Berkeley for the active discussions about the work and for provision of part of laboratory equipment for pulse electric field treatment. The author acknowledges Prof. Daniel Portnoy and Dr. Chris Rae from UC Berkeley for providing bacteria strains.

Corresponding authors for this study in [TECHNOLOGY](#) are Alex Golberg (agolberg@gmail.com), John H. Rossmeisl Jr. (jrossmei@vt.edu) and Michael B. Sano (sano@vt.edu).

About TECHNOLOGY

Fashioned as a high-impact, high-visibility, top-echelon publication, this new ground-breaking journal — TECHNOLOGY — will feature the development of cutting-edge new technologies in a broad array of emerging fields of science and engineering. The content will have an applied science and technological slant with a focus on both innovation and application to daily lives. It will cover diverse disciplines such as health and life science, energy and environment, advanced materials, technology-based manufacturing, information science and technology, and marine and transportations technologies.

About World Scientific Publishing Co.

World Scientific Publishing is a leading independent publisher of books and journals for the scholarly, research and professional communities. The company publishes about 500 books annually and more than 120 journals in various fields. World Scientific collaborates with prestigious organisations like the Nobel Foundation, US National Academies Press, as well as its subsidiary, the Imperial College Press, amongst others, to bring high quality academic and professional content to researchers and academics worldwide. To find out more about World Scientific, please visit www.worldscientific.com.
